Let's Start!

Introduction The best way to identify the requirements.

Learning Outcome:

Describe common activities at work to a using short sentences in familiar spoken and written situations.

Interpret the requirements report to determine the technological needs in managing information, based on rules and protocols established by the company.

Can Do Statements:

- I can understand what requirement elicitation process is.
- I can recognize the techniques of requirements elicitation.
- I can explain what requirement elicitation process and techniques are.

Ask your partner:

- What aspects do you consider important when collecting requirements for software design? Why?
- What are some common demands from clients when implementing a new software system?

Let's Explore!

How to elicit* requirements.

*"Elicit" means to extract and obtain the information you need.

Instructions: Read the text below.

We are going to discuss requirement elicitation, and some important techniques to collect and draw out software requirements.

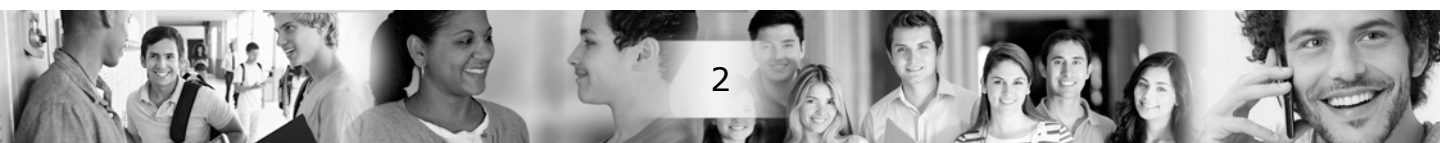

Requirement elicitation is the process of communicating with the clients, end-users, and all the participants in the development of the software to find out the requirements for the system.

There are four stages in the process of eliciting requirements: requirement gathering, which consists on discussing with the clients and users to know their desires about the software. Requirement organization, it's when the developers arrange requirements in order of priority. Negotiation and discussion, it's when the developers discuss and negotiate the requirements with clients in case there is conflict or ambiguity among requirements to finally document requirements. You should back up all the collected data, you don't want to lose all that information; in case you forget to backup you should download a data recovery software to help you.

There are some important techniques to gather the requirements you need to recognize: Interviews are a strong way to collect requirements, they can be structured, with close definite questions, or non-structured with open flexible questions; interviews can also be written or oral, one-to-one or in groups. Surveys are useful to query stakeholders about their expectations from the upcoming system. Questionnaires are a technique designed to gather customers' requirements, with the shortcoming that if they leave out of a question any issue, they won't take that issue into account.

Brainstorming is a technique in which participants hold a debate about the system; developers record their opinions for further requirement analysis. There is also an observation technique, in which developers visit the client's work place and observe the workflow in general and how workers deal with execution problems.

Requirement elicitation is a long complex process, developers use all those tools to decide on the best software system for each company.

Let's Practice!

Some techniques of requirements elicitation.

Instructions: Organize the mystery sentence. Read the sentences aloud. Check your pronunciation with your instructor.

1. the / debate / participants / system. / where / technique / brainstorming / There / about / a / is
2. to / collect / interviews / requirements. / help / that / There / are
3. that / surveys / stakeholders' / are / permit / and / collect / needs. / to / There / the / expectations
4. in / they / an / where / There / is / general. / observation / technique / observed / workflow

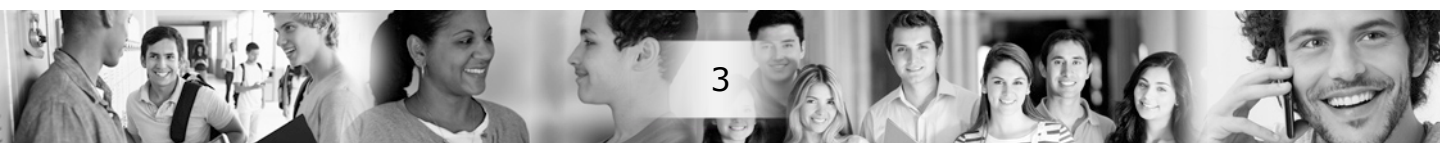

Let's Practice!

Techniques are very important in the requirement elicitation process.

Instructions: Select the correct answer.

1. In one of the stages of eliciting requirements, developers discuss with the clients _____ about the software.
(Hint: Remember how to use the infinitive of purpose.)
 - a. to knows our desires
 - b. to knowing their desire
 - c. to know their desires
2. _____ requirements, developers discuss and negotiate the requirements with clients.
(Hint: Remember that the verb after the infinitive of purpose doesn't change.)
 - a. To finally document
 - b. To finally documenting
 - c. To finally documents
3. _____, participants hold a debate about the system.
(Hint: Remember how to use the infinitive of purpose.)
 - a. To records client's opinions
 - b. To recording client's opinions
 - c. To record client's opinions
4. _____ stakeholders' expectations from the upcoming system, developers apply questionnaires.
(Hint: Remember that the verb doesn't change after in order to.)
 - a. In order to know the
 - b. In order to knowing the
 - c. In order to knows
5. Requirement elicitation is a complex process, developers use different tools _____ software system for each company.
(Hint: Remember how to use the infinitive of purpose.)
 - a. to decide on the best
 - b. to deciding on the best
 - c. to decides on the best

Extension Activity

Reinforce your knowledge about requirement elicitation process.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Read again the text about requirement elicitation process.
- Create a dialogue where you explain what the requirement elicitation process and techniques are.
- Read the dialogue aloud and correct your pronunciation with your instructor.

Self-Assessment

Yes

No

- I read the information about requirement elicitation process and requirement.
- I create an original dialogue.
- I share my work with my instructor.

☐ ☐
☐ ☐
☐ ☐

Target Words

- **query** (verb): to question
e.g. Surveys are useful to query stakeholders about their expectations from the upcoming system.
- **upcoming** (adjective): expected
e.g. Surveys are useful to query stakeholders about their expectations from the upcoming system.
- **shortcoming** (noun): a disadvantage
e.g. Questionnaires are a technique designed to gather customers' requirements, with the shortcoming that if they leave out of a question any issue, they won't take that issue into account.
- **workflow** (noun): the procedure that defines actors, actions, decisions and results
e.g. Developers visit the client's work place and observe the workflow in general and how workers deal with execution problems.
- **draw out** (phrasal verb): to discover
e.g. Some important techniques to collect and draw out software requirements.
- **stage** (noun): in this case, a step or point of a process
e.g. There are four stages in the process of eliciting requirements.

Learning Points

Infinitives of purpose.

We can use infinitives of verbs to show our mission or goal of what we are doing.

The preposition **to** expresses the reason we have for doing something, we can use it at the beginning or in the middle of a sentence.

Examples:

To improve customer service we need a new software.

I'm sorting out the requirements **to** start the analysis.

To add emphasis in a formal way, you can use in order and so as before the to-infinitive.

Example:

He makes a survey **in order to** know financial departments' opinion.

Developers gather all the information **so as to** know the expected results.

Remember that the verb with to is the one that shows the purpose of the actions, those actions can come either in simple present or present continuous.

Purpose	Actions
<i>To improve the system</i>	<i>we are changing the software.</i>
Actions	Purpose
<i>I always make a back-up copy</i>	<i>to protect my files.</i>

Examples

- Requirement elicitation is the process of communicating with the clients, end-users, and all the participants in the development of the software in order to find out the requirements for the system.
- Surveys are useful to query stakeholders about their expectations from the upcoming system.
- Questionnaires are a technique designed to gather customers' requirements.

Learning Points

Troubleshooting and giving advice.

When you troubleshoot a problem, means you solved the problem and everything is fine.

When you want to give an advice you usually use the modal verb should, but if the advice becomes stronger, you can use the modals **have to** or **must**.

Examples:

You should restart the computer.

Notice that the verb after "should" (restart) comes in the base form.

Another expression you can use to give advice is "why don't you" this means "you should try doing this, maybe it works".

Examples:

Why don't you reboot the system?

Why don't you run the antivirus?

Notice that the expression "why don't you" is actually a question in simple present, so you make it just as any other question in the present.

Useful sentences to talk about troubleshooting and advice

Did you initialize the drive?

Did you verify software compatibility?

You should download a data recovery software to help you.

You should back up all the restored data.

Why don't you try using the default password?

Why don't you run some tests to make sure everything is stable?

Examples

- You should back up all the collected data, you don't want to lose all that information.*
- In case you forget to backup you should download a data recovery software to help you.*
