Let's Start!

The Complexity of Requirement Analysis.

Learning Outcome:

Describe common activities at work using short sentences in familiar spoken and written situations.

Interpret the requirements report to determine the technological needs in managing information, based on rules and protocols established by the company.

Can Do Statements:

- I can explain what requirement analysis is.
- I can describe how a requirement analysis works.
- I can give detailed information related to requirement analysis.

Ask your partner:

- Why do you think analyzing requirements is important before starting any project?
- What are the most important facts to take into account when analyzing requirements?

Let's Explore!

Analyzing requirements is always the starting point of any project.

Instructions: Read the text below.

Imagine we are working on a very important project, and we are doing the requirement analysis, which is always the starting point of any project.

Requirement analysis is a process, which encircles several tasks required to define the needs and conditions for a new project or product; it encourages all the contradictory and conflicting requirements of various stakeholders. Analysts always have to set the project by analyzing, documenting, validating and managing the requirements the system needs to be successful. Requirement analysis is crucial for the development of a project.

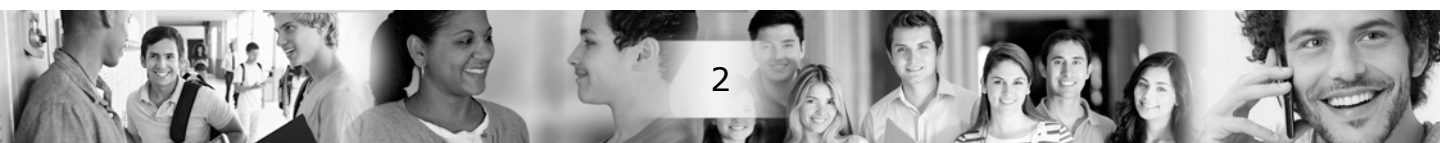

Requirement analysis is usually a very complex procedure. Let's find out more details to understand it.

Requirement analysis is always a long process in which participants have to deal with thousands of requirements, examine and record data using several techniques, accessing to files and downloading relevant information. Requirements have to be documented, measurable, and traceable among other characteristics; the purpose of those tasks is to identify business needs and opportunities and to collect detailed information for system design.

As we are doing the requirement analysis of a project, we need to know step by step how it works.

There are three main tasks in requirement analysis; first, we have requirement gathering or elicitation, in this step, analysts talk to all the stakeholders and participants of the project to determine what the requirements are. The second step is to analyze requirements; in this step, analysts decide if there are some unclear, incomplete, or contradictory requirements and solve the problems. The last step is to record the requirements using different tools, such as documents or user stories. Analysts keep track of all the requirements for the development of the project.

The project we are working on is very complex, but we have to be analytic, and assertive to make the project work.

**Let's Practice!****Defining Requirement Analysis.**

Instructions: Match the sentences from Column A with Column B. Read the sentences aloud. Check your pronunciation with your instructor.

COLUMN A

1. In our office we are setting the project, we have
2. Our staff is defining the needs and conditions for the new
3. Our team is measuring the new business opportunities. Please
4. Our experts are analyzing the best software for

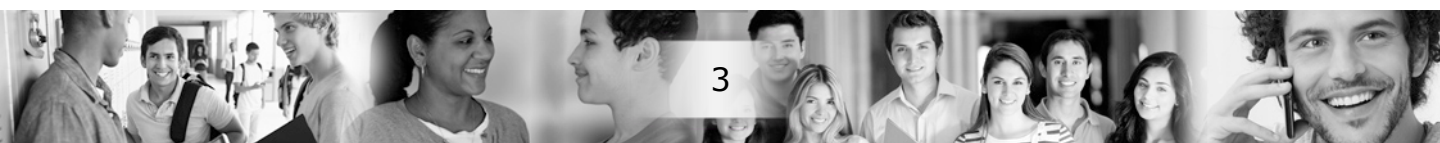

COLUMN B

- a. your company, please document their information and results.
- b. project, tell them to document the recording requirements.
- c. to analyze the requirements.
- d. provide the details for the system design.

**Let's Practice!****The Three Main Tasks in Requirement Analysis.**

Instructions: Read the sentences. Write the missing word(s) in the blanks. Use: there are analysts that talk, step there are some tools to, there is a set, if there are some.

1. When people talk about requirement analysis _____ of main tasks.
2. In the first step _____ to all the stakeholders and participants of the project to determine what the requirements are.
3. In the second step the analysts solve problems _____ unclear, incomplete, or contradictory requirements.
4. In the third _____ record the requirements like documents and user stories.

Extension Activity

Steps to complete a requirement analysis.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Read more about requirement analysis.
- Create a dialogue where you show the steps of the requirement analysis.
- Read aloud and check your pronunciation with your instructor.

Self-Assessment

Yes

No

1. I get more information about requirement analysis

☐ ☐

2. I write the dialogue where is the description of the steps of

☐ ☐

3. I read the dialogue and check my pronunciation with my instructor.

☐ ☐

Target Words

- **stakeholder** (noun): an investor owner of part of a company or business
e.g. In this step, analysts talk to all the stakeholders and participants of the project to determine what the requirements are.
- **deal with** (phrasal verb): to handle
e.g. Participants have to deal with thousands of requirements.
- **user story** (noun): in software development, a brief description of the user's everyday practices in relation to his/her job function
e.g. The last step is to record the requirements, using different tools as documents, or user stories.
- **requirement** (noun): a preliminary condition
e.g. Requirements have to be documented, measurable, and traceable among other characteristics.
- **development** (noun): progress, improvement or building
e.g. Analysts keep track of all the requirements for the development of the project.
- **task** (noun): activity to be completed
e.g. The purpose of those tasks is to identify business needs and opportunities.

Learning Points

Present Simple and Present Continuous - Affirmative.

We use both **present simple** and **present continuous** to talk about activities performed in the present; still the structures are very different.

Simple present is a structure used to talk about permanent situations in the present and general facts that are not likely to change.

Examples:

- *We **work** at a big multinational.*
- *I **know** about information systems.*

The **simple present** has a very simple structure in the **affirmative**; there is only one important fact you need to remember: when you talk indirectly about one single person or object you add an "**s**" or an "**es**" to the action.

Examples:

- *I **work** with computers.*
- *You **work** at the same company.*
- ***He knows** a lot about computers.*

Pronouns that usually have the **-s** or **-es** in the simple present are **he**, **she** and **it**. These are known as the **third person singular**.

There are some rules to add the **-s** to the third person singular:

1. If the verb finishes with the vowel **-o** we add **-es** to the verb.
2. If the verb finishes with a **consonant** plus **-y** we change **-y** for **-i** and add **-es**.
3. If the verb finishes with a **vowel** plus **-y** we just add the **-s** to the verb.
4. If the verb finishes with **-s**, **-ss**, **-ch**, **-sh**, **-x**, or any other sound similar to the **-ch**, we add **-es** to the verb.
5. For the verb **have**, change it for **has** in the third person.

Examples:

- *Go-**goes***
- *Apply-**applies***
- *Enjoy-**enjoys***
- *Watch- **watches***
- *Have-**has***

We use **Present continuous** to talk about temporary facts in the present, things that are happening just at the moment, but are going to change in the future.

Learning Points

Examples:

- *This year **we're** living in Bogotá.*
- *I'm **studying** systems at the moment.*

Notice that **present continuous** is usually accompanied by temporary time expressions. Do not forget the verb **to be** when you are making a **present continuous** sentence.

Examples:

- *Now I **am working** at a systems company.*
- *We **are repairing** systems at a café at the moment.*

There are some verbs in English we don't use in the present continuous, even if we are talking about a temporary situation happening at the moment of speaking. Those verbs are the ones related to emotions (like, hate) and verbs connected to mental functions (think, remember).

Simple present (permanent)	Present continuous (temporary)
• <i>I repair computers.</i>	• <i>I'm repairing computers at the moment.</i>
• <i>We know about systems.</i>	• <i>I know what I'm doing!</i>

Examples

- *Imagine we are working on a very important project.*
- *We are doing the requirement analysis, which is always the starting point of any project.*
- *As we are doing the requirement analysis of a project, we need to know step by step how it works.*
- *The project we are working on is very complex, but we have to be analytic, and assertive to make the project work.*

Learning Points

Common Collocations Related to Computers.

Collocation are pair of words or more words that usually go together in a sentence. There are some verbs that are usually accompanied by the same complements when we talk about computers.

Those collocations are very common in the computing jargon, and refer to actions we perform all the time when working with computers.

On the graph bellow there are some of the most common collocations you need to learn.

Example

- *Participants have to deal with thousands of requirements, examine and record data using several techniques, accessing to files and downloading relevant information.*
